

Agile Trajectory Generation for Tensile Perching with Aerial Robots

Progress Update

- Demonstrations
 - Demonstrations from both optimised trajectory (Hann) and Previous Work (Fabian).
 - Using these demonstrations in training.

Last Week

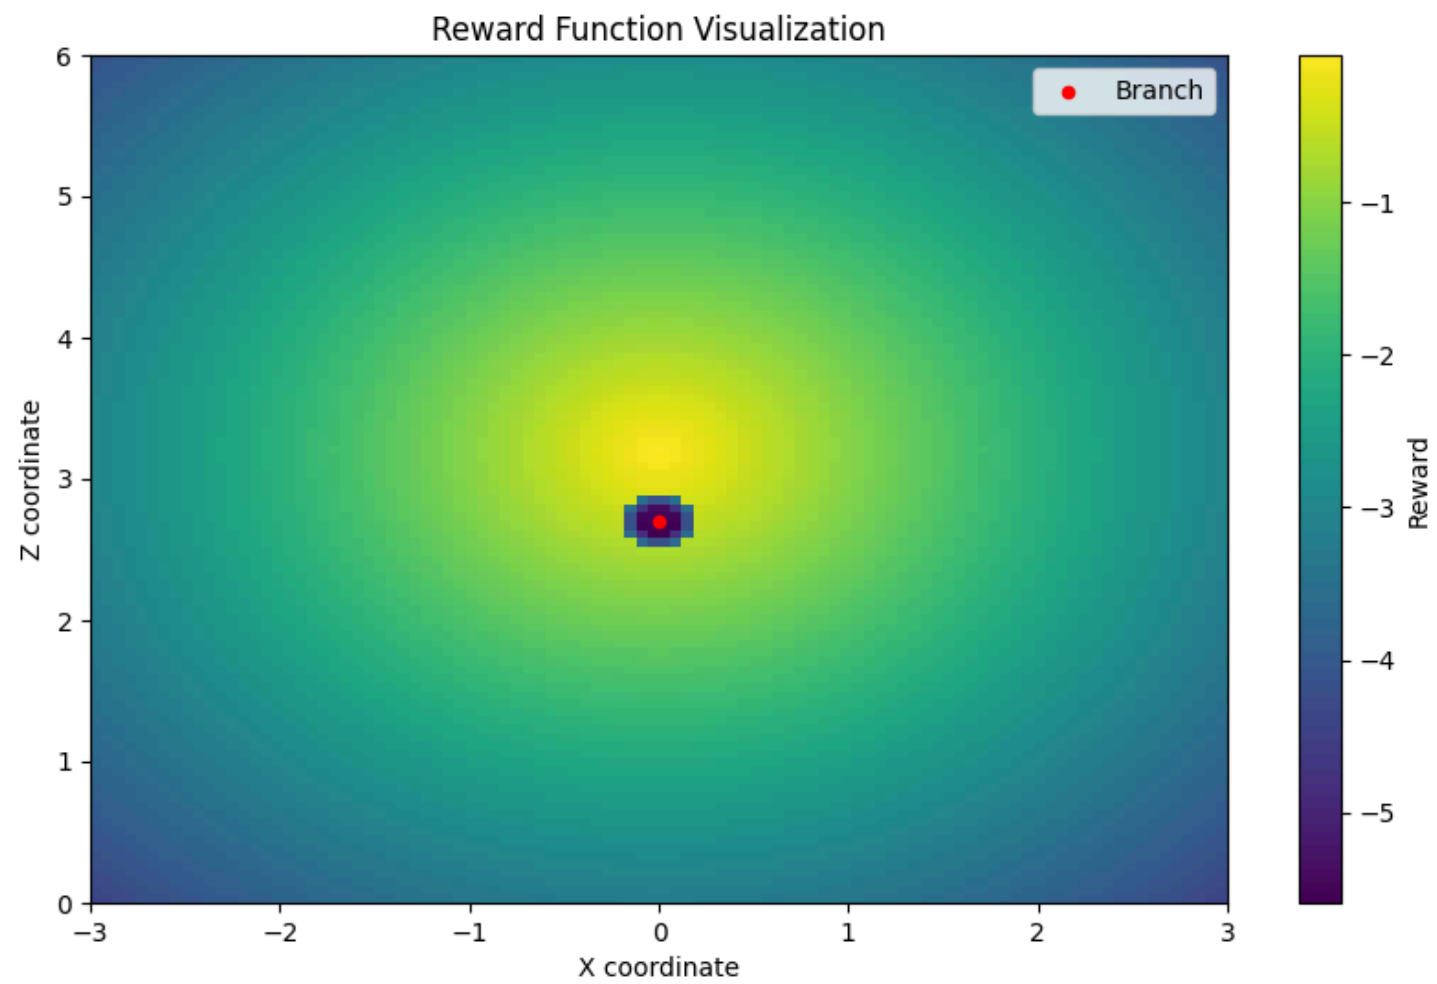

From Previous Week

- Issues faced
 - Resetting - fixed an issue with gravity in resetting.
 - Reward Function
 - done based on hitting tether to branch - stop condition is when there is a collision between the centre portion of the tether and the branch.
 - collision - penalise contact between drone and branch - large collision penalty.
 - Trajectory Smoothness Term
- Learning from Demonstrations System
- By next week: Approaching stage finished with comparison results between SAC and SACfD.

Reward

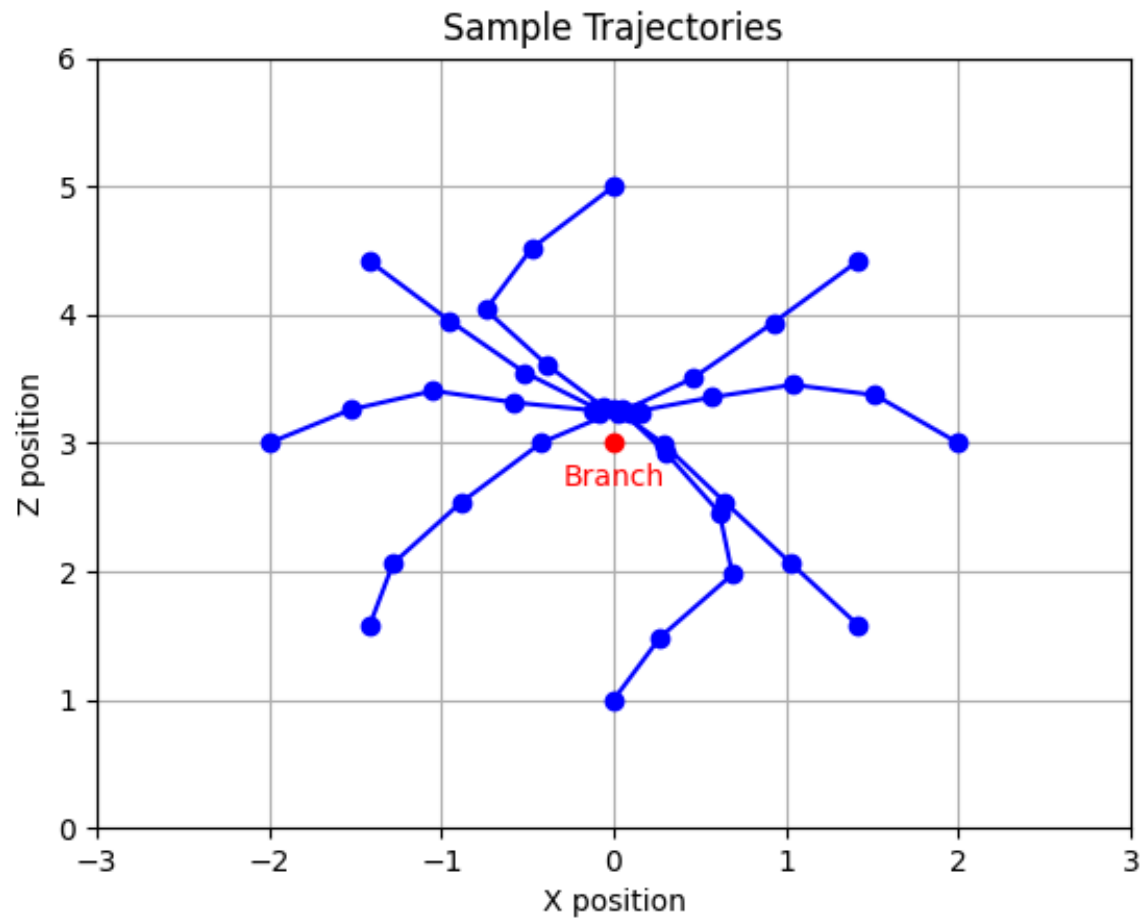

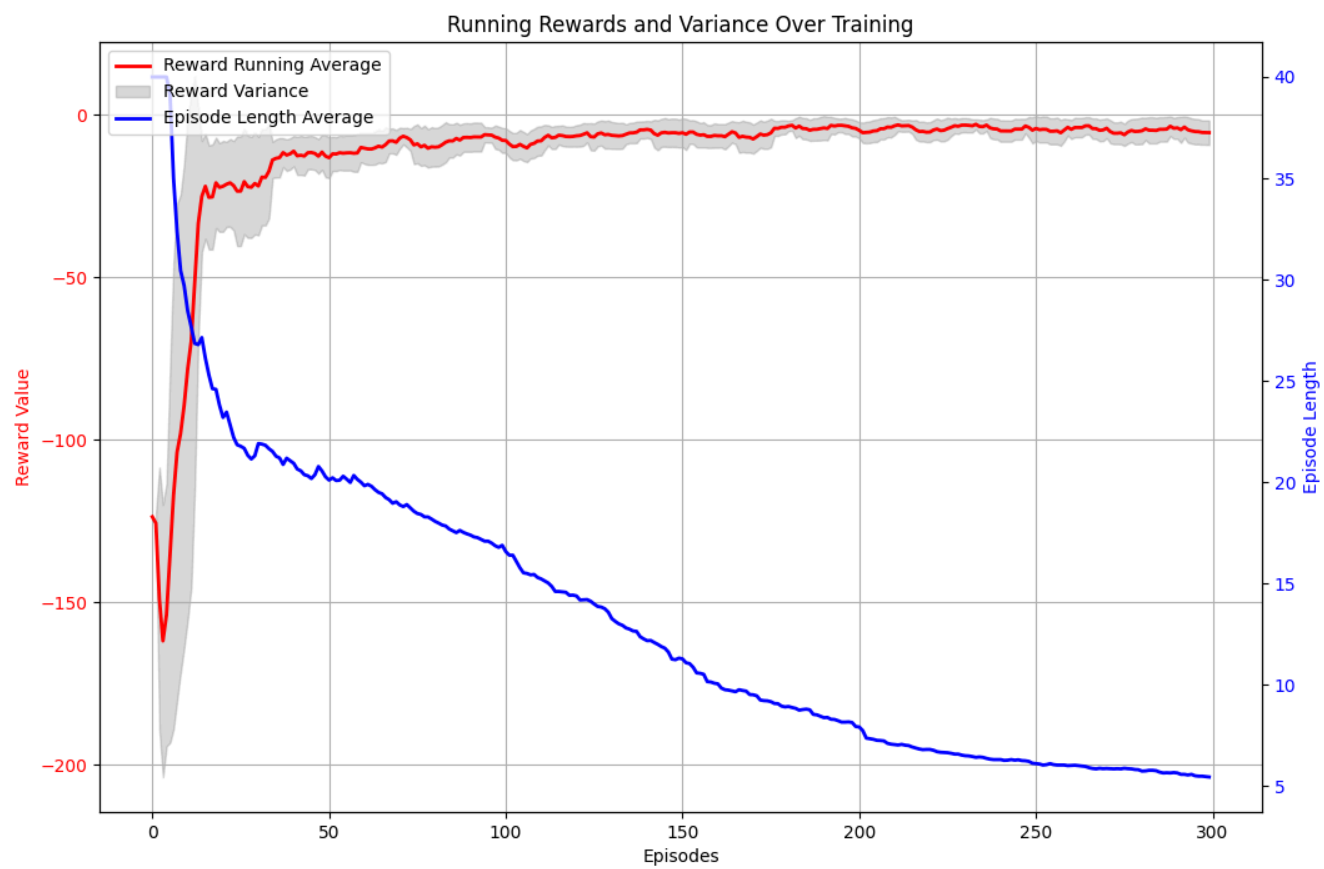

Trajectories

Comparison between SAC and SACfD

Next Steps

- Further Statistics on the training
 - Crashes.
- Smoothness
 - Already a smoothness term which can be seen in easy tasks.
 - Introduce Prioritised Experience Replay to help combat the harder learning portions.
 - Sampling learnable parameter.
- Move onto next stage:
 - Wrapping

Questions

- For the paper:
 - How would you suggest going about cutting down the background/related work section?
